

ABSTRACT OF THE DISCLOSURE

A gaming device that provides a second or replicating display that is an enlarged, preferably simulated replica of the actual display of the reels, paylines and indicia of the paystops of the gaming device. The second or replicating display can exactly recreate the actual rotation or random generation of the reels, represent the random generation of the reels, and do so by providing a slight delay. The present invention also contains a method by which the replicating display presents each of a plurality of award generating or winning paylines individually and sequentially for a predetermined amount of time before culminating in a display of the accumulated winning paylines. The method enables the player to easily see the source of an award, which would otherwise be difficult to discern from a multitude of paylines.
